Mathematics Standards of Learning

Curriculum Framework 2009

Grade 6

Board of Education
Commonwealth of Virginia
The 2009 *Mathematics Standards of Learning* Curriculum Framework is a companion document to the 2009 *Mathematics Standards of Learning* and amplies the *Mathematics Standards of Learning* by defining the content knowledge, skills, and understandings that are measured by the Standards of Learning assessments. The Curriculum Framework provides additional guidance to school divisions and their teachers as they develop an instructional program appropriate for their students. It assists teachers in their lesson planning by identifying essential understandings, defining essential content knowledge, and describing the intellectual skills students need to use. This supplemental framework delineates in greater specificity the content that all teachers should teach and all students should learn.

Each topic in the *Mathematics Standards of Learning* Curriculum Framework is developed around the Standards of Learning. The format of the Curriculum Framework facilitates teacher planning by identifying the key concepts, knowledge and skills that should be the focus of instruction for each standard. The Curriculum Framework is divided into three columns: Understanding the Standard; Essential Understandings; and Essential Knowledge and Skills. The purpose of each column is explained below.

*Understanding the Standard*
This section includes background information for the teacher (K-8). It contains content that may extend the teachers’ knowledge of the standard beyond the current grade level. This section may also contain suggestions and resources that will help teachers plan lessons focusing on the standard.

*Essential Understandings*
This section delineates the key concepts, ideas and mathematical relationships that all students should grasp to demonstrate an understanding of the Standards of Learning. In Grades 6-8, these essential understandings are presented as questions to facilitate teacher planning.

*Essential Knowledge and Skills*
Each standard is expanded in the Essential Knowledge and Skills column. What each student should know and be able to do in each standard is outlined. This is not meant to be an exhaustive list nor a list that limits what is taught in the classroom. It is meant to be the key knowledge and skills that define the standard.

The Curriculum Framework serves as a guide for Standards of Learning assessment development. Assessment items may not and should not be a verbatim reflection of the information presented in the Curriculum Framework. Students are expected to continue to apply knowledge and skills from Standards of Learning presented in previous grades as they build mathematical expertise.
In the middle grades, the focus of mathematics learning is to
• build on students’ concrete reasoning experiences developed in the elementary grades;
• construct a more advanced understanding of mathematics through active learning experiences;
• develop deep mathematical understandings required for success in abstract learning experiences; and
• apply mathematics as a tool in solving practical problems.

Students in the middle grades use problem solving, mathematical communication, mathematical reasoning, connections, and representations to integrate understanding within this strand and across all the strands.

• Students in the middle grades focus on mastering rational numbers. Rational numbers play a critical role in the development of proportional reasoning and advanced mathematical thinking. The study of rational numbers builds on the understanding of whole numbers, fractions, and decimals developed by students in the elementary grades. Proportional reasoning is the key to making connections to most middle school mathematics topics.

• Students develop an understanding of integers and rational numbers by using concrete, pictorial, and abstract representations. They learn how to use equivalent representations of fractions, decimals, and percents and recognize the advantages and disadvantages of each type of representation. Flexible thinking about rational number representations is encouraged when students solve problems.

• Students develop an understanding of the properties of operations on real numbers through experiences with rational numbers and by applying the order of operations.

• Students use a variety of concrete, pictorial, and abstract representations to develop proportional reasoning skills. Ratios and proportions are a major focus of mathematics learning in the middle grades.
6.1 The student will describe and compare data, using ratios, and will use appropriate notations, such as $\frac{a}{b}$, $a$ to $b$, and $a:b$.

### UNDERSTANDING THE STANDARD
(Background Information for Instructor Use Only)

- A ratio is a comparison of any two quantities. A ratio is used to represent relationships within and between sets.
- A ratio can compare part of a set to the entire set (part-whole comparison).
- A ratio can compare part of a set to another part of the same set (part-part comparison).
- A ratio can compare part of a set to a corresponding part of another set (part-part comparison).
- A ratio can compare all of a set to all of another set (whole-whole comparison).
- The order of the quantities in a ratio is directly related to the order of the quantities expressed in the relationship. For example, if asked for the ratio of the number of cats to dogs in a park, the ratio must be expressed as the number of cats to the number of dogs, in that order.
- A ratio is a multiplicative comparison of two numbers, measures, or quantities.
- All fractions are ratios and vice versa.
- Ratios may or may not be written in simplest form.
- Ratios can compare two parts of a whole.
- Rates can be expressed as ratios.

### ESSENTIAL UNDERSTANDINGS

- What is a ratio? A ratio is a comparison of any two quantities. A ratio is used to represent relationships within a set and between two sets. A ratio can be written using fraction form ($\frac{2}{3}$), a colon (2:3), or the word to (2 to 3).

### ESSENTIAL KNOWLEDGE AND SKILLS

The student will use problem solving, mathematical communication, mathematical reasoning, connections, and representations to

- Describe a relationship within a set by comparing part of the set to the entire set.
- Describe a relationship between two sets by comparing part of one set to a corresponding part of the other set.
- Describe a relationship between two sets by comparing all of one set to all of the other set.
- Describe a relationship within a set by comparing one part of the set to another part of the same set.
- Represent a relationship in words that makes a comparison by using the notations $\frac{a}{b}$, $a:b$, and $a$ to $b$.
- Create a relationship in words for a given ratio expressed symbolically.
The student will
a) investigate and describe fractions, decimals and percents as ratios;
b) identify a given fraction, decimal or percent from a representation;
c) demonstrate equivalent relationships among fractions, decimals, and percents; and
d) compare and order fractions, decimals, and percents.

UNDERSTANDING THE STANDARD
(Background Information for Instructor Use Only)

- **Percent** means “per 100” or how many “out of 100”; percent is another name for *hundredths*.
- A number followed by a percent symbol (%) is equivalent to that number with a denominator of 100
  (e.g., $30\% = \frac{30}{100} = \frac{3}{10} = 0.3$).
- Percents can be expressed as fractions with a denominator of 100 (e.g., $75\% = \frac{75}{100} = \frac{3}{4}$).
- Percents can be expressed as decimal (e.g., $38\% = \frac{38}{100} = 0.38$).
- Some fractions can be rewritten as equivalent fractions with denominators of powers of 10, and
  can be represented as decimals or percents (e.g., $\frac{3}{5} = \frac{6}{10} = \frac{60}{100} = 0.60 = 60\%$).
- Decimals, fractions, and percents can be represented using concrete materials (e.g., Base-10 blocks, number lines, decimal squares, or grid paper).
- Percents can be represented by drawing shaded regions on grids or by finding a location on number lines.
- Percents are used in real life for taxes, sales, data description, and data comparison.

ESSENTIAL UNDERSTANDINGS

- What is the relationship among fractions, decimals and percents?
  Fractions, decimals, and percents are three different ways to express the same number. A ratio can be written using fraction form ($\frac{2}{3}$), a colon (2:3), or the word *to* (2 to 3). Any number that can be written as a fraction can be expressed as a terminating or repeating decimal or a percent.

ESSENTIAL KNOWLEDGE AND SKILLS

The student will use problem solving, mathematical communication, mathematical reasoning, connections, and representations to

- Identify the decimal and percent equivalents for numbers written in fraction form including repeating decimals.
- Represent fractions, decimals, and percents on a number line.
- Describe orally and in writing the equivalent relationships among decimals, percents, and fractions that have denominators that are factors of 100.
- Represent, by shading a grid, a fraction, decimal, and percent.
- Represent in fraction, decimal, and percent form a given shaded region of a grid.
- Compare two decimals through thousandths using manipulatives, pictorial representations, number lines, and symbols ($<$, $\leq$, $>$, $=$).
- Compare two fractions with denominators of 12 or less using manipulatives, pictorial representations, number lines, and symbols ($<$, $\leq$, $>$, $=$).
- Compare two percents using pictorial representations and symbols ($<$, $\leq$, $>$, $=$).
6.2 The student will
a) investigate and describe fractions, decimals and percents as ratios;
b) identify a given fraction, decimal or percent from a representation;
c) demonstrate equivalent relationships among fractions, decimals, and percents; and
d) compare and order fractions, decimals, and percents.

<th>ESSENTIAL UNDERSTANDINGS</th>
<th>ESSENTIAL KNOWLEDGE AND SKILLS</th>
</tr>
</thead>
</table>
| \[ \frac{4}{7} > \frac{3}{9}. \]  

- When comparing two fractions close to 1, use distance from 1 as your benchmark. Example:
  Which is greater, \( \frac{6}{7} \) or \( \frac{8}{9} \)? \( \frac{6}{7} \) is \( \frac{1}{7} \) away from 1 whole. \( \frac{8}{9} \) is \( \frac{1}{9} \) away from 1 whole. Since \( \frac{1}{7} > \frac{1}{9} \), then \( \frac{6}{7} \) is a greater distance away from 1 whole than \( \frac{8}{9} \). So \( \frac{8}{9} > \frac{6}{7} \).  

- Students should have experience with fractions such as \( \frac{1}{8} \), whose decimal representation is a terminating decimal (e.g., \( \frac{1}{8} = 0.125 \)) and with fractions such as \( \frac{2}{9} \), whose decimal representation does not end but continues to repeat (e.g., \( \frac{2}{9} = 0.222… \)). The repeating decimal can be written with ellipses (three dots) as in 0.222… or denoted with a bar above the digits that repeat as in \( 0.\overline{2} \).
6.3 The student will
  a) identify and represent integers;
  b) order and compare integers; and
  c) identify and describe absolute value of integers.

<table>
<thead>
<tr>
<th>UNDERSTANDING THE STANDARD (Background Information for Instructor Use Only)</th>
<th>ESSENTIAL UNDERSTANDINGS</th>
<th>ESSENTIAL KNOWLEDGE AND SKILLS</th>
</tr>
</thead>
</table>
| • Integers are the set of whole numbers, their opposites, and zero.  
  • Positive integers are greater than zero.  
  • Negative integers are less than zero.  
  • Zero is an integer that is neither positive nor negative.  
  • A negative integer is always less than a positive integer.  
  • When comparing two negative integers, the negative integer that is closer to zero is greater.  
  • An integer and its opposite are the same distance from zero on a number line. For example, the opposite of 3 is -3.  
  • The absolute value of a number is the distance of a number from zero on the number line regardless of direction. Absolute value is represented as $|–6| = 6$.  
  • On a conventional number line, a smaller number is always located to the left of a larger number (e.g., $–7$ lies to the left of $–3$, thus $–7 < –3$; 5 lies to the left of 8 thus 5 is less than 8). | • What role do negative integers play in practical situations? Some examples of the use of negative integers are found in temperature (below 0), finance (owing money), below sea level. There are many other examples.  
  • How does the absolute value of an integer compare to the absolute value of its opposite? They are the same because an integer and its opposite are the same distance from zero on a number line. | The student will use problem solving, mathematical communication, mathematical reasoning, connections, and representations to  
  • Identify an integer represented by a point on a number line.  
  • Represent integers on a number line.  
  • Order and compare integers using a number line.  
  • Compare integers, using mathematical symbols ($<$, $>$, $=$).  
  • Identify and describe the absolute value of an integer. |
6.4 The student will demonstrate multiple representations of multiplication and division of fractions.

<tr>
<td>• Using manipulatives to build conceptual understanding and using pictures and sketches to link concrete examples to the symbolic enhance students’ understanding of operations with fractions and help students connect the meaning of whole number computation to fraction computation.</td>
<td>• When multiplying fractions, what is the meaning of the operation? When multiplying a whole by a fraction such as $3 \times \frac{1}{2}$, the meaning is the same as with multiplication of whole numbers: 3 groups the size of $\frac{1}{2}$ of the whole. When multiplying a fraction by a fraction such as $\frac{2}{3} \times \frac{3}{4}$, we are asking for part of a part. When multiplying a fraction by a whole number such as $\frac{1}{2} \times 6$, we are trying to find a part of the whole.</td>
<td>The student will use problem solving, mathematical communication, mathematical reasoning, connections, and representations to demonstrate multiplication and division of fractions using multiple representations.</td>
</tr>
<tr>
<td>• Multiplication and division of fractions can be represented with arrays, paper folding, repeated addition, repeated subtraction, fraction strips, pattern blocks and area models.</td>
<td>• What does it mean to divide with fractions? For measurement division, the divisor is the number of groups and the quotient will be the number of groups in the dividend. Division of fractions can be explained as how many of a given divisor are needed to equal the given dividend. In other words, for $\frac{1}{4} \div \frac{2}{3}$, the question is, “How many $\frac{2}{3}$ make $\frac{1}{4}$?” For partition division the divisor is the size of the group, so the quotient answers the question, “How much is the whole?” or “How much for one?”</td>
<td>• Demonstrate multiplication and division of fractions using multiple representations.</td>
</tr>
<tr>

</tr>
<tr>
<td>• Perfect squares are the numbers that result from multiplying any whole number by itself (e.g., $36 = 6 \times 6 = 6^2$).</td>
<td></td>
<td>• Recognize powers of ten by examining patterns in a place value chart: $10^4 = 10,000$, $10^3 = 1000$, $10^2 = 100$, $10^1 = 10$, $10^0 = 1$.</td>
</tr>
<tr>
<td>• Perfect squares can be represented geometrically as the areas of squares the length of whose sides are whole numbers (e.g., $1 \times 1$, $2 \times 2$, or $3 \times 3$). This can be modeled with grid paper, tiles, geoboards and virtual manipulatives.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
In the middle grades, the focus of mathematics learning is to
• build on students’ concrete reasoning experiences developed in the elementary grades;
• construct a more advanced understanding of mathematics through active learning experiences;
• develop deep mathematical understandings required for success in abstract learning experiences; and
• apply mathematics as a tool in solving practical problems.

Students in the middle grades use problem solving, mathematical communication, mathematical reasoning, connections, and representations to integrate understanding within this strand and across all the strands.

• Students develop conceptual and algorithmic understanding of operations with integers and rational numbers through concrete activities and discussions that bring meaning to why procedures work and make sense.
• Students develop and refine estimation strategies and develop an understanding of when to use algorithms and when to use calculators. Students learn when exact answers are appropriate and when, as in many life experiences, estimates are equally appropriate.
• Students learn to make sense of the mathematical tools they use by making valid judgments of the reasonableness of answers.
• Students reinforce skills with operations with whole numbers, fractions, and decimals through problem solving and application activities.
STANDARD 6.6  
STRAND: COMPUTATION AND ESTIMATION  
GRADE LEVEL 6

6.6  The student will
a) multiply and divide fractions and mixed numbers; and
b) estimate solutions and then solve single-step and multistep practical problems involving addition, subtraction, multiplication, and division of fractions.

UNDERSTANDING THE STANDARD  
(Background Information for Instructor Use Only)

- Simplifying fractions to simplest form assists with uniformity of answers.
- Addition and subtraction are inverse operations as are multiplication and division.
- It is helpful to use estimation to develop computational strategies. For example, \( \frac{7}{8} \div \frac{3}{4} \) is about \( \frac{3}{4} \) of 3, so the answer is between 2 and 3.
- When multiplying a whole by a fraction such as \( 3 \cdot \frac{1}{2} \), the meaning is the same as with multiplication of whole numbers: 3 groups the size of \( \frac{1}{2} \) of the whole.
- When multiplying a fraction by a fraction such as \( \frac{2}{3} \cdot \frac{3}{4} \), we are asking for part of a part.
- When multiplying a fraction by a whole number such as \( \frac{1}{2} \cdot 6 \), we are trying to find a part of the whole.

ESSENTIAL UNDERSTANDINGS

- How are multiplication and division of fractions and multiplication and division of whole numbers alike? Fraction computation can be approached in the same way as whole number computation, applying those concepts to fractional parts.
- What is the role of estimation in solving problems? Estimation helps determine the reasonableness of answers.

ESSENTIAL KNOWLEDGE AND SKILLS

The student will use problem solving, mathematical communication, mathematical reasoning, connections, and representations to

- Multiply and divide with fractions and mixed numbers. Answers are expressed in simplest form.
- Solve single-step and multistep practical problems that involve addition and subtraction with fractions and mixed numbers, with and without regrouping, that include like and unlike denominators of 12 or less. Answers are expressed in simplest form.
- Solve single-step and multistep practical problems that involve multiplication and division with fractions and mixed numbers that include denominators of 12 or less. Answers are expressed in simplest form.
6.7 The student will solve single-step and multistep practical problems involving addition, subtraction, multiplication, and division of decimals.

<th>ESSENTIAL UNDERSTANDINGS</th>
<th>ESSENTIAL KNOWLEDGE AND SKILLS</th>
</tr>
</thead>
<tbody>
<tr>
<td>• The order of operations is a convention that defines the computation order to follow in simplifying an expression.</td>
<td>• What is the significance of the order of operations? The order of operations prescribes the order to use to simplify expressions containing more than one operation. It ensures that there is only one correct answer.</td>
<td>The student will use problem solving, mathematical communication, mathematical reasoning, connections, and representations to</td>
</tr>
</tbody>
</table>
| • The order of operations is as follows:  
  – First, complete all operations within grouping symbols*. If there are grouping symbols within other grouping symbols, do the innermost operation first.  
  – Second, evaluate all exponential expressions.  
  – Third, multiply and/or divide in order from left to right.  
  – Fourth, add and/or subtract in order from left to right.  
  * Parentheses ( ), brackets [ ], braces { }, and the division bar – as in $\frac{3+4}{5+6}$ should be treated as grouping symbols. | | • Simplify expressions by using the order of operations in a demonstrated step-by-step approach. The expressions should be limited to positive values and not include braces { } or absolute value | |
| • The power of a number represents repeated multiplication of the number (e.g., $8^3 = 8 \cdot 8 \cdot 8$). The base is the number that is multiplied, and the exponent represents the number of times the base is used as a factor. In the example, 8 is the base, and 3 is the exponent. | | • Find the value of numerical expressions, using order of operations, mental mathematics, and appropriate tools. Exponents are limited to positive values. |
| • Any number, except 0, raised to the zero power is 1. Zero to the zero power is undefined. | |  

Mathematics Standards of Learning Curriculum Framework 2009: Grade 6
In the middle grades, the focus of mathematics learning is to

- build on students’ concrete reasoning experiences developed in the elementary grades;
- construct a more advanced understanding of mathematics through active learning experiences;
- develop deep mathematical understandings required for success in abstract learning experiences; and
- apply mathematics as a tool in solving practical problems.

Students in the middle grades use problem solving, mathematical communication, mathematical reasoning, connections, and representations to integrate understanding within this strand and across all the strands.

- Students develop the measurement skills that provide a natural context and connection among many mathematics concepts. Estimation skills are developed in determining length, weight/mass, liquid volume/capacity, and angle measure. Measurement is an essential part of mathematical explorations throughout the school year.

- Students continue to focus on experiences in which they measure objects physically and develop a deep understanding of the concepts and processes of measurement. Physical experiences in measuring various objects and quantities promote the long-term retention and understanding of measurement. Actual measurement activities are used to determine length, weight/mass, and liquid volume/capacity.

- Students examine perimeter, area, and volume, using concrete materials and practical situations. Students focus their study of surface area and volume on rectangular prisms, cylinders, pyramids, and cones.
6.9 The student will make ballpark comparisons between measurements in the U.S. Customary System of measurement and measurements in the metric system.

**UNDERSTANDING THE STANDARD**
(Background Information for Instructor Use Only)

- Making sense of various units of measure is an essential life skill, requiring reasonable estimates of what measurements mean, particularly in relation to other units of measure.
  - 1 inch is about 2.5 centimeters.
  - 1 foot is about 30 centimeters.
  - 1 meter is a little longer than a yard, or about 40 inches.
  - 1 mile is slightly farther than 1.5 kilometers.
  - 1 kilometer is slightly farther than half a mile.
  - 1 ounce is about 28 grams.
  - 1 nickel has the mass of about 5 grams.
  - 1 kilogram is a little more than 2 pounds.
  - 1 quart is a little less than 1 liter.
  - 1 liter is a little more than 1 quart.
  - Water freezes at 0°C and 32°F.
  - Water boils at 100°C and 212°F.
  - Normal body temperature is about 37°C and 98°F.
  - Room temperature is about 20°C and 70°F.
- Mass is the amount of matter in an object. Weight is the pull of gravity on the mass of an object. The mass of an object remains the same regardless of its location. The weight of an object changes dependent on the gravitational pull at its location. In everyday life, most people are actually interested in determining an object’s mass, although they use the term weight, as shown by the questions: “How much does it weigh?” versus “What is its mass?”
- The degree of accuracy of measurement required is determined by the situation.

**ESSENTIAL UNDERSTANDINGS**

- What is the difference between weight and mass? Weight and mass are different. Mass is the amount of matter in an object. Weight is the pull of gravity on the mass of an object. The mass of an object remains the same regardless of its location. The weight of an object changes dependent on the gravitational pull at its location.
- How do you determine which units to use at different times? Units of measure are determined by the attributes of the object being measured. Measures of length are expressed in linear units, measures of area are expressed in square units, and measures of volume are expressed in cubic units.
- Why are there two different measurement systems? Measurement systems are conventions invented by different cultures to meet their needs. The U.S. Customary System is the preferred method in the United States. The metric system is the preferred system worldwide.

**ESSENTIAL KNOWLEDGE AND SKILLS**

- The student will use problem solving, mathematical communication, mathematical reasoning, connections, and representations to:
  - Estimate the conversion of units of length, weight/mass, volume, and temperature between the U.S. Customary system and the metric system by using ballpark comparisons.
    Ex: 1 L ≈ 1qt.  Ex: 4L ≈ 4 qts.
  - Estimate measurements by comparing the object to be measured against a benchmark.
6.9 The student will make ballpark comparisons between measurements in the U.S. Customary System of measurement and measurements in the metric system.

6.10 The student will  
   a) define pi (π) as the ratio of the circumference of a circle to its diameter;  
   b) solve practical problems involving circumference and area of a circle, given the diameter or radius;  
   c) solve practical problems involving area and perimeter; and  
   d) describe and determine the volume and surface area of a rectangular prism.

UNDERSTANDING THE STANDARD  
(Background Information for Instructor Use Only)

- Experiences in deriving the formulas for area, perimeter, and volume using manipulatives such as tiles, one-inch cubes, adding machine tape, graph paper, geoboards, or tracing paper, promote an understanding of the formulas and facility in their use.
- The perimeter of a polygon is the measure of the distance around the polygon.
- Circumference is the distance around or perimeter of a circle.
- The area of a closed curve is the number of nonoverlapping square units required to fill the region enclosed by the curve.
- The perimeter of a square whose side measures $s$ is 4 times $s$ ($P = 4s$), and its area is side times side ($A = s^2$).
- The perimeter of a rectangle is the sum of twice the length and twice the width ($P = 2l + 2w$, or $P = 2(l + w)$), and its area is the product of the length and the width ($A = lw$).
- The value of pi ($\pi$) is the ratio of the circumference of a circle to its diameter.
- The ratio of the circumference to the diameter of a circle is a constant value, pi ($\pi$), which can be approximated by measuring various sizes of circles.

ESSENTIAL UNDERSTANDINGS

- What is the relationship between the circumference and diameter of a circle?  
  The circumference of a circle is about 3 times the measure of the diameter.
- What is the difference between area and perimeter?  
  Perimeter is the distance around the outside of a figure while area is the measure of the amount of space enclosed by the perimeter.
- What is the relationship between area and surface area?  
  Surface area is calculated for a three-dimensional figure. It is the sum of the areas of the two-dimensional surfaces that make up the three-dimensional figure.

ESSENTIAL KNOWLEDGE AND SKILLS

The student will use problem solving, mathematical communication, mathematical reasoning, connections, and representations to

- Derive an approximation for pi (3.14 or $\frac{22}{7}$) by gathering data and comparing the circumference to the diameter of various circles, using concrete materials or computer models.
- Find the circumference of a circle by substituting a value for the diameter or the radius into the formula $C = \pi d$ or $C = 2\pi r$.
- Find the area of a circle by using the formula $A = \pi r^2$.
- Apply formulas to solve practical problems involving area and perimeter of triangles and rectangles.
- Create and solve problems that involve finding the circumference and area of a circle when given the diameter or radius.
- Solve problems that require finding the surface area of a rectangular prism, given a diagram of the prism with the necessary dimensions labeled.
- Solve problems that require finding the volume of a rectangular prism given a diagram of the prism with the necessary dimensions labeled.
6.10 The student will
a) define pi (π) as the ratio of the circumference of a circle to its diameter;
b) solve practical problems involving circumference and area of a circle, given the diameter or radius;
c) solve practical problems involving area and perimeter; and
d) describe and determine the volume and surface area of a rectangular prism.

†Revised March 2011
In the middle grades, the focus of mathematics learning is to
• build on students’ concrete reasoning experiences developed in the elementary grades;
• construct a more advanced understanding of mathematics through active learning experiences;
• develop deep mathematical understandings required for success in abstract learning experiences; and
• apply mathematics as a tool in solving practical problems.

Students in the middle grades use problem solving, mathematical communication, mathematical reasoning, connections, and representations to integrate understanding within this strand and across all the strands.

• Students expand the informal experiences they have had with geometry in the elementary grades and develop a solid foundation for the exploration of geometry in high school. Spatial reasoning skills are essential to the formal inductive and deductive reasoning skills required in subsequent mathematics learning.

• Students learn geometric relationships by visualizing, comparing, constructing, sketching, measuring, transforming, and classifying geometric figures. A variety of tools such as geoboards, pattern blocks, dot paper, patty paper, miras, and geometry software provides experiences that help students discover geometric concepts. Students describe, classify, and compare plane and solid figures according to their attributes. They develop and extend understanding of geometric transformations in the coordinate plane.

• Students apply their understanding of perimeter and area from the elementary grades in order to build conceptual understanding of the surface area and volume of prisms, cylinders, pyramids, and cones. They use visualization, measurement, and proportional reasoning skills to develop an understanding of the effect of scale change on distance, area, and volume. They develop and reinforce proportional reasoning skills through the study of similar figures.

• Students explore and develop an understanding of the Pythagorean Theorem. Mastery of the use of the Pythagorean Theorem has far-reaching impact on subsequent mathematics learning and life experiences.

The van Hiele theory of geometric understanding describes how students learn geometry and provides a framework for structuring student experiences that should lead to conceptual growth and understanding.

• **Level 0: Pre-recognition.** Geometric figures are not recognized. For example, students cannot differentiate between three-sided and four-sided polygons.

• **Level 1: Visualization.** Geometric figures are recognized as entities, without any awareness of parts of figures or relationships between components of a figure. Students should recognize and name figures and distinguish a given figure from others that look somewhat the same. (This is the expected level of student performance during grades K and 1.)

• **Level 2: Analysis.** Properties are perceived but are isolated and unrelated. Students should recognize and name properties of geometric figures. (Students are expected to transition to this level during grades 2 and 3.)
• **Level 3: Abstraction.** Definitions are meaningful, with relationships being perceived between properties and between figures. Logical implications and class inclusions are understood, but the role and significance of deduction is not understood. (Students should transition to this level during grades 5 and 6 and fully attain it before taking algebra.)

• **Level 4: Deduction.** Students can construct proofs, understand the role of axioms and definitions, and know the meaning of necessary and sufficient conditions. Students should be able to supply reasons for steps in a proof. (Students should transition to this level before taking geometry.)
6.11 The student will
a) identify the coordinates of a point in a coordinate plane; and
b) graph ordered pairs in a coordinate plane.

UNDERSTANDING THE STANDARD
(Background Information for Instructor Use Only)

- In a coordinate plane, the coordinates of a point are typically represented by the ordered pair \((x, y)\), where \(x\) is the first coordinate and \(y\) is the second coordinate. However, any letters may be used to label the axes and the corresponding ordered pairs.

- The quadrants of a coordinate plane are the four regions created by the two intersecting perpendicular number lines. Quadrants are named in counterclockwise order. The signs on the ordered pairs for quadrant I are \((+,+)\); for quadrant II, \((-,+)\); for quadrant III, \((-,-)\); and for quadrant IV, \((+,-)\).

- In a coordinate plane, the origin is the point at the intersection of the x-axis and y-axis; the coordinates of this point are \((0,0)\).

- For all points on the x-axis, the y-coordinate is 0. For all points on the y-axis, the x-coordinate is 0.

- The coordinates may be used to name the point. (e.g., the point \((2,7)\)). It is not necessary to say “the point whose coordinates are \((2,7)\)”.

ESSENTIAL UNDERSTANDINGS

- Can any given point be represented by more than one ordered pair? The coordinates of a point define its unique location in a coordinate plane. Any given point is defined by only one ordered pair.

- In naming a point in the plane, does the order of the two coordinates matter? Yes. The first coordinate tells the location of the point to the left or right of the y-axis and the second point tells the location of the point above or below the x-axis. Point \((0, 0)\) is at the origin.

ESSENTIAL KNOWLEDGE AND SKILLS

The student will use problem solving, mathematical communication, mathematical reasoning, connections, and representations to

- Identify and label the axes of a coordinate plane.
- Identify and label the quadrants of a coordinate plane.
- Identify the quadrant or the axis on which a point is positioned by examining the coordinates (ordered pair) of the point.
- Graph ordered pairs in the four quadrants and on the axes of a coordinate plane.
- Identify ordered pairs represented by points in the four quadrants and on the axes of the coordinate plane.
- Relate the coordinate of a point to the distance from each axis and relate the coordinates of a single point to another point on the same horizontal or vertical line.†

<tbody>
<tr>
<td>(Background Information for Instructor Use Only)</td>
<td>What does the phrase “measure of center” mean? This is a collective term for the 3 types of averages for a set of data – mean, median, and mode.</td>
<td>The student will use problem solving, mathematical communication, mathematical reasoning, connections, and representations to</td>
</tr>
<tr>
<td>• Measures of center are types of averages for a data set. They represent numbers that describe a data set. Mean, median, and mode are measures of center that are useful for describing the average for different situations. Mean works well for sets of data with no very high or low numbers. Median is a good choice when data sets have a couple of values much higher or lower than most of the others. Mode is a good descriptor to use when the set of data has some identical values or when data are not conducive to computation of other measures of central tendency, as when working with data in a yes or no survey.</td>
<td>What is meant by mean as balance point? Mean can be defined as the point on a number line where the data distribution is balanced. This means that the sum of the distances from the mean of all the points above the mean is equal to the sum of the distances of all the data points below the mean. This is the concept of mean as the balance point.</td>
<td>• Find the mean for a set of data.</td>
</tr>
<tr>
<td>• The mean is the numerical average of the data set and is found by adding the numbers in the data set together and dividing the sum by the number of data pieces in the set.</td>
<td></td>
<td>• Describe the three measures of center and a situation in which each would best represent a set of data.</td>
</tr>
<tr>
<td>• In grade 5 mathematics, mean is defined as fair-share.</td>
<td>• Mean can be defined as the point on a number line where the data distribution is balanced. This means that the sum of the distances from the mean of all the points above the mean is equal to the sum of the distances of all the data points below the mean. This is the concept of mean as the balance point.</td>
<td>• Identify and draw a number line that demonstrates the concept of mean as balance point for a set of data.</td>
</tr>
<tr>
<td>• Defining mean as balance point is a prerequisite for understanding standard deviation.</td>
<td></td>
<td></td>

• develop deep mathematical understandings required for success in abstract learning experiences; and
• apply mathematics as a tool in solving practical problems.

Students in the middle grades use problem solving, mathematical communication, mathematical reasoning, connections, and representations to integrate understanding within this strand and across all the strands.

• Students extend their knowledge of patterns developed in the elementary grades and through life experiences by investigating and describing functional relationships.

• Students learn to use algebraic concepts and terms appropriately. These concepts and terms include variable, term, coefficient, exponent, expression, equation, inequality, domain, and range. Developing a beginning knowledge of algebra is a major focus of mathematics learning in the middle grades.

• Students learn to solve equations by using concrete materials. They expand their skills from one-step to two-step equations and inequalities.

• Students learn to represent relations by using ordered pairs, tables, rules, and graphs. Graphing in the coordinate plane linear equations in two variables is a focus of the study of functions.
6.17 The student will identify and extend geometric and arithmetic sequences.

### UNDERSTANDING THE STANDARD
(Background Information for Instructor Use Only)
- Numerical patterns may include linear and exponential growth, perfect squares, triangular and other polygonal numbers, or Fibonacci numbers.
- Arithmetic and geometric sequences are types of numerical patterns.
- In the numerical pattern of an arithmetic sequence, students must determine the difference, called the common difference, between each succeeding number in order to determine what is added to each previous number to obtain the next number. Sample numerical patterns are 6, 9, 12, 15, 18, …; and 5, 7, 9, 11, 13, ….
- In geometric number patterns, students must determine what each number is multiplied by to obtain the next number in the geometric sequence. This multiplier is called the common ratio. Sample geometric number patterns include 2, 4, 8, 16, 32, …; 1, 5, 25, 125, 625, …; and 80, 20, 5, 1.25, ….
- Strategies to recognize and describe the differences between terms in numerical patterns include, but are not limited to, examining the change between consecutive terms, and finding common factors. An example is the pattern 1, 2, 4, 7, 11, 16, …

### ESSENTIAL UNDERSTANDINGS
- What is the difference between an arithmetic and a geometric sequence? While both are numerical patterns, arithmetic sequences are additive and geometric sequences are multiplicative.

### ESSENTIAL KNOWLEDGE AND SKILLS
- The student will use problem solving, mathematical communication, mathematical reasoning, connections, and representations to:
  - Investigate and apply strategies to recognize and describe the change between terms in arithmetic patterns.
  - Investigate and apply strategies to recognize and describe geometric patterns.
  - Describe verbally and in writing the relationships between consecutive terms in an arithmetic or geometric sequence.
  - Extend and apply arithmetic and geometric sequences to similar situations.
  - Extend arithmetic and geometric sequences in a table by using a given rule or mathematical relationship.
  - Compare and contrast arithmetic and geometric sequences.
  - Identify the common difference for a given arithmetic sequence.
  - Identify the common ratio for a given geometric sequence.
6.18 The student will solve one-step linear equations in one variable involving whole number coefficients and positive rational solutions.

<td>• Identity elements are numbers that combine with other numbers without changing the other numbers. The additive identity is zero (0). The multiplicative identity is one (1). There are no identity elements for subtraction and division.</td>
<td>• What is the result of multiplying any real number by zero? The product is always zero.</td>
<td>• Identify a real number equation that represents each property of operations with real numbers, when given several real number equations.</td>
</tr>
<tr>
<td>• The additive identity property states that the sum of any real number and zero is equal to the given real number (e.g., 5 + 0 = 5).</td>
<td>• Do all real numbers have a multiplicative inverse? No. Zero has no multiplicative inverse because there is no real number that can be multiplied by zero resulting in a product of one.</td>
<td>• Test the validity of properties by using examples of the properties of operations on real numbers.</td>
</tr>
<tr>
<td>• The multiplicative identity property states that the product of any real number and one is equal to the given real number (e.g., 8 · 1 = 8).</td>
<td></td>
<td>• Identify the property of operations with real numbers that is illustrated by a real number equation.</td>
</tr>
<tr>
<td>• Inverses are numbers that combine with other numbers and result in identity elements.</td>
<td></td>
<td>NOTE: The commutative, associative and distributive properties are taught in previous grades.</td>
</tr>
<tr>
<td>• The multiplicative inverse property states that the product of a number and its multiplicative inverse (or reciprocal) always equals one (e.g., 4 · 1/4 = 1).</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Zero has no multiplicative inverse.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• The multiplicative property of zero states that the product of any real number and zero is zero.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Division by zero is not a possible arithmetic operation. Division by zero is undefined.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
6.20 The student will graph inequalities on a number line.

### UNDERSTANDING THE STANDARD
(Background Information for Instructor Use Only)

- Inequalities using the < or > symbols are represented on a number line with an open circle on the number and a shaded line over the solution set. Ex: \( x < 4 \)

![Number line showing inequality](image)

- When graphing \( x \leq 4 \) fill in the circle above the 4 to indicate that the 4 is included.

- Inequalities using the \( \leq \) or \( \geq \) symbols are represented on a number line with a closed circle on the number and shaded line in the direction of the solution set.

- The solution set to an inequality is the set of all numbers that make the inequality true.

- It is important for students to see inequalities written with the variable before the inequality symbol and after. For example \( x > -6 \) and \( 7 > y \).

### ESSENTIAL UNDERSTANDINGS

- In an inequality, does the order of the elements matter?
  Yes, the order does matter. For example, \( x > 5 \) is not the same relationship as \( 5 > x \). However, \( x > 5 \) is the same relationship as \( 5 < x \).

### ESSENTIAL KNOWLEDGE AND SKILLS

- The student will use problem solving, mathematical communication, mathematical reasoning, connections and representation to
  - Given a simple inequality with integers, graph the relationship on a number line.
  - Given the graph of a simple inequality with integers, represent the inequality two different ways using symbols (<, >, ≤, ≥).
