Course description: In Precalculus, students utilize their understanding of arithmetic, algebra, and geometry to solve situations involving polynomial, rational, exponential, and trigonometric functions, conic sections, and partial fractions. Assessments are done in a variety of formats: multiple-choice, short response, extended response, and major situation-based applications.

As a pilot project, learning goals for this course are derived from the Common Core, newly evolving national standards in the United States. Additional information may be found at: http://www.corestandards.org/the-standards/mathematics

| **Unit 1**                           | 1. Students will identify the steps in the problem solving process following the procedure: problem, formulate, compute, interpret, validate, and report.  
2. Students will apply the process to real-world problems.  
3. Students will solve equations graphically, numerically, algebraically, and report their results verbally and in writing.  
4. Students will solve inequalities algebraically and graphically, and report the meaning of the solutions verbally and in writing.  
5. Students will be able to define units in a general context.  
6. Students will be able to identify common units for physical quantities.  
7. Students will be able to identify when quantities can be added or subtracted based on units, as well as what quantities can be multiplied to get the desired units.  
8. Students will be able to translate from one type of similar unit to another (for example, feet into meters or vice versa).  
9. Students will choose the best quantity for modeling a given scenario.  
10. Students will be able to select the best scale to view the problem and its solution both numerically and graphically. | 1. How can we write explanations of mathematical problems and solutions using words?  
2. What is a mathematical model, and how can we construct them so they may be applied to solve real-world problems?  
3. What different information can be determined about a problem when we examine it from a graphical, numerical, and algebraic standpoint?  
4. In what circumstances in the real world would inequalities be both appropriate and an accurate display of what we want to accomplish?  
5. What role do units play in the construction of mathematical models?  
6. What information can we get about a situation described in a mathematical model based entirely on the units used?  
7. How should the selection of scale be different between different mathematical models? (ex: examining cells in biology and building houses?) | *(Note: this unit is mostly covered in the prerequisite chapter and chapter 1.1, with the exception of quantity and units, which must be addressed separately.)* |

**Goal Set 1:**  
**M1:** Students will develop a framework for approaching, formulating, computing, interpreting, and reporting problems and their solutions.  
**N-Q1:** Use units as a way to understand problems and to guide the solution of multi-step problems; choose and interpret units consistently in formulas; choose and interpret scale and the origin in graphs and data displays.  
**N-Q2:** Define appropriate quantities for the purpose of descriptive modeling.  
**N-Q3:** Choose a level of accuracy appropriate to limitations on measurement when reporting quantities.
## Unit 2  Functions

**F-IF1**: Understand that a function from one set (called the domain) to another set (called the range) assigns each element of the domain exactly one element of the range. If \( f \) is a function and \( x \) is an element of its domain, then \( f(x) \) denotes the output of \( f \) corresponding to the input \( x \). The graph of \( f \) is the graph of the equation \( y = f(x) \).

**F-IF2**: Use function notation, evaluate functions for inputs in their domains, and interpret statements that use function notation in terms of a context.

**F-IF4**: For a function that models a relationship between two quantities, interpret key features of graphs and tables in terms of the quantities, and sketch graphs showing key features given a verbal description of the relationship. Key features include: intercepts; intervals where the function is increasing, decreasing, positive, or negative; relative maximums and minimums; symmetries; end behavior; and periodicity.

**F-IF5**: Relate the domain of a function to its graph and, where applicable, to the quantitative relationship it describes. For example, if the function \( h(n) \) gives the number of person-hours it takes to assemble \( n \) engines in a factory, then the positive integers would be an appropriate domain for the function.

**F-IF6**: Calculate and interpret the average rate of change of a function (presented symbolically or as a table) over a specified interval. Estimate the rate of change from a graph.

<table>

<td>Students will be able to manipulate and combine functions into other functions, and interpret the meaning of the new function.</td>
</tr>
<tr>
<td>12.</td>
<td>Students will be able to define and construct inverse functions.</td>
</tr>
<tr>
<td>13.</td>
<td>Students will be able to identify when two functions are inverses</td>
</tr>
</tbody>
</table>

1. What would an appropriate analogy for a function be?
2. Why is a function restricted to one output for every input?
3. What are the forms that a function can take, and what are the advantages of each form?
4. What information can we determine from the graph of a function?
5. What are some examples of things that behave like functions from real life?
6. What can we learn about a situation that has vertical or horizontal asymptotes?
7. In what real world situations do we use average rate of change?
8. How can two functions be combined?
9. In what circumstances could we describe a situation as the combination of two functions?

(Note: This is a new section based on the national Common Core and these topics are represented on the SAT’s and the SAT II’s.)
F-IF9: Compare properties of two functions each represented in a different way (algebraically, graphically, numerically in tables, or by verbal descriptions). For example, given a graph of one quadratic function and an algebraic expression for another, say which has the larger maximum.

F-BF1: Write a function that describes a relationship between two quantities.
   a. Determine an explicit expression, a recursive process, or steps for calculation from a context.
   b. Combine standard function types using arithmetic operations. For example, build a function that models the temperature of a cooling body by adding a constant function to a decaying exponential, and relate these functions to the model.
   c. (+) Compose functions. For example, if \( T(y) \) is the temperature in the atmosphere as a function of height, and \( h(t) \) is the height of a weather balloon as a function of time, then \( T(h(t)) \) is the temperature at the location of the weather balloon as a function of time.

F-BF3: Identify the effect on the graph of replacing \( f(x) \) by \( f(x) + k \), \( kf(x) \), \( f(kx) \) and \( f(x + k) \) for specific values of \( k \) (both positive and negative); find the value of \( k \) given the graphs. Experiment with cases and illustrate an explanation of the effects on the graph using technology. Include recognizing even and odd functions from their graphs and algebraic expressions for them.

F-BF4: Find inverse functions.
   a. Solve an equation of the form \( f(x) = c \) for a simple function \( f \) that has an inverse and write an expression for the inverse.

#### Unit 3  Polynomials, power models, and rational functions

**F-IF7**: Graph functions expressed symbolically and show key features of the graph, by hand in simple cases and using technology for more complicated cases.

- a. Graph linear and quadratic functions and show intercepts, maxima, and minima.
- b. Graph square root, cube root, and piecewise-defined functions, including step functions and absolute value functions.
- c. Graph polynomial functions, identifying zeros when suitable factorizations are available, and showing end behavior.
- d. Graph rational functions, identifying zeros and asymptotes when suitable factorizations are available, and showing end behavior.

**N-RN1**: Explain how the definition of the meaning of rational exponents follows from extending the properties of integer exponents to those values, allowing for a notation for radicals in terms of rational exponents.

**F-IF8**: Write a function defined by an expression in different but equivalent forms to reveal and explain different properties of the function.

- a. Use the process of factoring and completing the square in a quadratic

--- Linear, Quadratic, and Polynomial Equations REMIX exam
function to show zeros, extreme values, and symmetry of the graph, and interpret these in terms of a context.
b. Use the properties of exponents to interpret expressions for exponential functions.

**N-CN1**: Know there is a complex number $i$ such that $i^2 = -1$, and every complex number has the form $a + bi$ with $a$ and $b$ real.

**N-CN2**: Use the relation $i^2 = -1$ and the commutative, associative, and distributive properties to add, subtract, and multiply complex numbers.

**N-CN3**: Find the conjugate of a complex number; use conjugates to find moduli and quotients of complex numbers.

**N-CN4**: Represent complex numbers on the complex plane in rectangular and polar form (including real and imaginary numbers), and explain why the rectangular and polar forms of a given complex number represent the same number.

---

### Unit 4 Exponential, logistic, and logarithmic functions

**F-IF7e**: Graph exponential and logarithmic functions, showing intercepts and end behavior.

**F-BF5**: Understand the inverse relationship between exponents and logarithms and use this relationship to solve problems involving logarithms and exponents.

**F-LE1c**: Recognize situations in which a quantity grows or decays by a constant percent rate per unit interval relative to

| 1. Students will be able to identify an exponential function from the form of the equation. | 1. What does an exponential function represent? |
| 2. Students will construct and interpret graphs of exponential functions. | 2. What are the consequences of unbounded exponential growth? |
| 3. Students will be able to determine the end behavior of an exponential function, and interpret the meaning of the end behavior in the context of real world situations. | 3. What are the characteristics of a graph of an exponential function? |
| 4. Students will model population growth and decay, and interpret the computed information in context. | 4. In what elements of life might we see exponential decay? |
| 5. Students will be able to define a logarithmic equation, and interpret the meaning of the logarithm. | 5. How are exponential and logarithmic functions related? |

---

Logarithms and Exponential Functions Exam — this exam also serves as a sample Pre-AP-style test

Music Mixing Boards and Logarithms handout—used after experiencing the procedures for mixing sound with a board & public address (PA) system.

Application of Trigonometry Exploration Project
another.

**F-LE2:** Construct exponential functions given a graph, a description of a relationship, or two input-output pairs (include reading these from a table).

**F-LE3:** Observe using graphs and tables that a quantity increasing exponentially eventually exceeds a quantity increasing linearly, quadratically, or (more generally) as a polynomial function.

**F-LE4** For exponential models, express as a logarithm the solution to $ab^x = d$ where $a$, $c$, and $d$ are numbers, and the base $b$ is 2, 10, or $e$; evaluate the logarithm using technology.

**F-LE5:** Interpret the parameters in a linear or exponential function in terms of a context.

### Unit 5 Trigonometry

**F-TF** Extend the domain of trigonometric functions using the unit circle

1. Understand radian measure of an angle as the length of the arc on the unit circle subtended by the angle.

2. Explain how the unit circle in the coordinate plane enables the extension of trigonometric functions to all real numbers, interpreted as radian measures of angles traversed counterclockwise around the unit circle.

3. (+) Use special triangles to determine geometrically the values of sine, cosine, tangent for $\pi/3$, $\pi/4$ and $\pi/6$, and use the unit circle to express the values of sine, cosines, and tangent for $x$, $\pi+x$, and $2\pi-x$ in terms of their values for $x$, where $x$ is any real number.

4. (+) Use the unit circle to explain symmetry (odd graphs of logarithms, or if shown a graph, students will be able to identify the graph as logarithmic based on key features such as asymptotes and intercepts.

5. Students will be able to solve logarithmic and exponential functions in order to determine key values for real-world problems.

6. How can we model a real life situation with a logarithmic equation?

7. How does sound intensity relate to logarithms?

8. When is it more accurate to use a logistic equation?

</tbody>
</table>

**Precalculus Final Project:**

**Polynomial Predictions:** What will your home town look like in 10 years?
a. Add vectors end-to-end, component-wise, and by the parallelogram rule. Understand that the magnitude of a sum of two vectors is typically not the sum of the magnitudes.

b. Given two vectors in magnitude and direction form, determine the magnitude and direction of their sum.

c. Understand vector subtraction \( v - w \) as \( v + (-w) \), where \( -w \) is the additive inverse of \( w \), with the same magnitude as \( w \) and pointing in the opposite direction. Represent vector subtraction graphically by connecting the tips in the appropriate order, and perform vector subtraction component-wise.

5. (+) Multiply a vector by a scalar.

a. Represent scalar multiplication graphically by scaling vectors and possibly reversing their direction; perform scalar multiplication component-wise, e.g., as \( c(v_x, v_y) = (cv_x, cv_y) \).

b. Compute the magnitude of a scalar multiple \( cv \) using \( ||cv|| = |c|v \). Compute the direction of \( cv \) knowing that when \( |c|v \neq 0 \), the direction of \( cv \) is either along \( v \) (for \( c > 0 \)) or against \( v \) (for \( c < 0 \)).

G-SRT Apply trigonometry to general triangles

9. (+) Derive the formula \( A = \frac{1}{2} ab \sin(C) \) for the area of a triangle by drawing an auxiliary line from a vertex perpendicular to the opposite side.

10. (+) Prove the Laws of Sines and Cosines and use them to solve problems.

11. (+) Understand and apply the Law of Sines and the Law of Cosines to find unknown measurements in right and non-right triangles (e.g., surveying problems, resultant forces).

Unit 8 Matrix Operations

A-REI Solve systems of equations

5. Prove that, given a system of two equations in two variables, students will be able to find the value of the variables.

1. When presented with a system of two equations, students will be able to find the value of the variables.

2. Students will apply their solutions to situations involving supply and demand.

1. What are some possible uses for solving systems of equations?

2. What is a general solution for determining...
variables, replacing one equation by the sum of that
equation and a multiple of the other produces a system
with the same solutions.

Common Core State Standards for Mathematics

6. Solve systems of linear equations exactly and
approximately (e.g., with graphs), focusing on pairs of
linear equations in two variables.

7. Solve a simple system consisting of a linear
equation and a quadratic equation in two variables
algebraically and graphically. For example, find the
points of intersection between the line $y = -3x$ and the
circle $x^2 + y^2 = 3$.

8. $(+)$ Represent a system of linear equations as a
single matrix equation in a vector variable.

9. $(+)$ Find the inverse of a matrix if it exists and use
it to solve systems of linear equations (using
technology for matrices of dimension $3 \times 3$ or greater).

| 3. Students will be able to solve systems of two equations graphically and numerically. |
| 4. Students will be able to solve systems of equations where one of the equations is not linear graphically and algebraically. |
| 5. Students will be able to use matrices to solve systems of 3 or more equations using Row – Echelon Form (REF). |
| 3. What are the benefits to solving a system of equations graphically or numerically? |
| the optimal production rate for a supply and demand problem? |
